LABSHEET-08

Q1. Display the installed RPM version and verify that the rpm command is available on the system.

rpm --version

Q2. Display the installed DNF version and verify that the dnf command is available on the system.

dnf --version

Q3. Search the installed RPM database for a selected package and determine whether it is installed.

rpm -qa | grep bash

or

rpm -q bash

Q4. Display detailed information about an installed package using rpm.

rpm -qi bash

Q5. List all files installed by a selected RPM package using rpm.

rpm -ql bash

Q6. Identify which installed RPM package owns a specified file on the system.

rpm -qf /bin/bash

Q7. Query the RPM database and display the installation date and other available information for a selected package.

rpm -qi bash

Q8. List the currently configured DNF repositories and identify their enabled/disabled status.

sudo dnf repolist all

Q9. Display detailed information about a selected DNF repository.

sudo dnf repoinfo appstream

Q10. Search the configured repositories for a package by name or keyword using dnf.

sudo dnf search zsh

Q11. Install a suitable package using dnf and verify that the package has been installed.

sudo dnf install -y zsh

rpm -q zsh

Q12. Install a package from an available repository and verify its installed version using rpm and dnf.

sudo dnf install -y tree

rpm -q tree

sudo dnf list installed tree

Q13. Display available updates for installed packages using dnf without immediately applying them.

sudo dnf check-update

Q14. Update a selected installed package using dnf and verify the new version.

sudo dnf update -y tree

rpm -q tree

Q15. Update all packages for which updates are available and verify the result.

sudo dnf update -y

sudo dnf check-update

Q16. Remove a selected test package using dnf and verify that it has been removed.

sudo dnf remove -y tree

rpm -q tree

Q17. Demonstrate how to identify the repository that provides a selected package.

sudo dnf info zsh

Q18. Display the transaction history of DNF and identify a recent install, update or removal transaction.

sudo dnf history

Q19. Use rpm to verify package installation and use dnf to install, update and remove a suitable test package as a complete workflow.

sudo dnf install -y nano

rpm -q nano

sudo dnf update -y nano

sudo dnf remove -y nano

rpm -q nano

Q20. Clean up the packages and repository changes created during the lab and verify that no required system package or repository has been unintentionally modified.

sudo dnf remove -y zsh 2>/dev/null

sudo dnf autoremove -y

sudo dnf clean all
